15 The Top Soft Drink Brands by Advertising Expenditures 2017 – 2022 ----- 25

Appendix

A. U.S. Population by Region 1983 – 2022----- 26

A number of variables affect the per capita consumption of CSDs, including weather, historical consumption trends, strength of local bottlers and success of product alternatives.

- Relatively hot weather and fewer alternative beverages characterize the South and the Southwest. The West Central and the East Central regions also have fewer alternative beverages than the coastal regions.
- Since the Northeast and the Pacific have many more alternative beverage choices than other regions, both have a CSD per capita consumption rate beneath the national average.
- Nonetheless, the per capita consumption rate of CSDs in the Northeast stood about 14 gallons higher than that in the Pacific region in 2022. This is probably because healthy lifestyles are given especial importance in the latter region.
- The Pacific has had a long history of heavy bottled water consumption. In 2002, a sort of watershed event occurred — people in the Pacific drank more bottled water than CSDs for the first time. This has since occurred in two other regions: the Northeast and the Southwest.
- When compared to the East Central, the Northeast continues to confound expectations. Despite having about 10 million more people, the Northeast lags behind the East Central in terms of overall CSD consumption.
- The West region also trails the national average. Per capita consumption in the region fell from 27.7 gallons in 2021 to 24.4 gallons in 2022.
- All regions are expected to have dwindling per capita consumption in the next five years.
